

Nuxt.js 综合案例

介绍

- GitHub仓库: <https://github.com/gothinkster/realworld>
- 在线示例: <https://demo.realworld.io/#/>
- 接口文档: <https://github.com/gothinkster/realworld/tree/master/api>
- 页面模板: https://github.com/gothinkster/realworld-starter-kit/blob/master/Frontend_INSTRUCTIONS.md

创建项目

```
# 创建项目目录
mkdir realworld-nuxtjs

# 进入项目目录
cd realworld-nuxtjs

# 生成 package.json 文件
npm init -y

# 安装 nuxt 依赖
npm install nuxt
```

在 `package.json` 中添加启动脚本:

```
"scripts": {
  "dev": "nuxt"
}
```

创建 `pages/index.vue`:

```
<template>
  <div>
    <h1>Home Page</h1>
  </div>
</template>

<script>
export default {
  name: 'HomePage'
}
</script>

<style>

</style>
```

启动服务:

```
npm run dev
```

在浏览器中访问 <http://localhost:3000/> 测试。

导入样式资源

`app.html` :

```
<!DOCTYPE html>
<html {{ HTML_ATTRS }}>
  <head {{ HEAD_ATTRS }}>
    {{ HEAD }}
    <!-- Import Ionicon icons & Google Fonts our Bootstrap theme relies on -->
    <link
href="https://cdn.jsdelivr.net/npm/ionicons@2.0.1/css/ionicons.min.css"
rel="stylesheet" type="text/css">
    <link href="//fonts.googleapis.com/css?
family=Titillium+Web:700|Source+Serif+Pro:400,700|Merriweather+Sans:400,700|Source+Sans+Pro:400,300,600,700,300italic,400italic,600italic,700italic"
rel="stylesheet" type="text/css">
    <!-- Import the custom Bootstrap 4 theme from our hosted CDN -->
    <!-- <link rel="stylesheet" href="//demo.productionready.io/main.css"> -->
    <link rel="stylesheet" href="/index.css">
  </head>
  <body {{ BODY_ATTRS }}>
    {{ APP }}
  </body>
</html>
```

布局组件

`pages/layout/index.vue`

```
<template>
  <div>
    <nav class="navbar navbar-light">
      <div class="container">
        <nuxt-link class="navbar-brand" to="/">conduit</nuxt-link>
        <ul class="nav navbar-nav pull-xs-right">
          <li class="nav-item">
            <!-- Add "active" class when you're on that page -->
            <nuxt-link class="nav-link active" to="/">Home</nuxt-link>
          </li>
          <li class="nav-item">
            <nuxt-link class="nav-link" to="/editor">
              <i class="ion-compose"></i>&nbsp;New Post
            </nuxt-link>
          </li>
          <li class="nav-item">
            <nuxt-link class="nav-link" to="/settings">
              <i class="ion-gear-a"></i>&nbsp;Settings
            </nuxt-link>
          </li>
          <li class="nav-item">
```

```

        <nuxt-link class="nav-link" to="/profile/lpz">
          
          LPZ
        </nuxt-link>
      </li>
      <li class="nav-item">
        <nuxt-link class="nav-link" to="/login">
          Sign in
        </nuxt-link>
      </li>
      <li class="nav-item">
        <nuxt-link class="nav-link" to="/register">
          Sign up
        </nuxt-link>
      </li>
    </ul>
  </div>
</nav>
<nuxt-child />
<footer>
  <div class="container">
    <nuxt-link class="logo-font" to="/">conduit</nuxt-link>
    <span class="attribution">
      An interactive learning project from <a
href="https://kaiwu.lagou.com/">lagou</a>. Code & design licensed under MIT.
    </span>
  </div>
</footer>
</div>
</template>

<script>
export default {
  name: 'LayoutIndex'
}
</script>

<style>

</style>

```

登录注册

pages/login.vue

```

<template>
  <div class="auth-page">
    <div class="container page">
      <div class="row">

        <div class="col-md-6 offset-md-3 col-xs-12">
          <h1 class="text-xs-center">{{ isLogin ? 'Sign in' : 'Sign up' }}</h1>
          <p class="text-xs-center">

```

```

        <nuxt-link v-if="isLogin" to="/register">Need an account?</nuxt-
link>

        <nuxt-link v-else to="/login">Have an account?</nuxt-link>
    </p>

    <ul class="error-messages">
        <li>That email is invalid.</li>
    </ul>

    <form>
        <fieldset v-if="!isLogin" class="form-group">
            <input class="form-control form-control-lg" type="text"
placeholder="Your Name">
        </fieldset>
        <fieldset class="form-group">
            <input class="form-control form-control-lg" type="email"
placeholder="Email">
        </fieldset>
        <fieldset class="form-group">
            <input class="form-control form-control-lg" type="password"
placeholder="Password">
        </fieldset>
        <button class="btn btn-lg btn-primary pull-xs-right">
            {{ isLogin ? 'Sign in' : 'Sign up' }}
        </button>
    </form>
</div>

</div>
</div>
</div>
</template>

<script>
export default {
  name: 'LoginIndex',
  asyncData () {
  },
  data () {
    return {}
  },
  computed: {
    isLogin () {
      return this.$route.path === '/login'
    }
  }
}
</script>

<style>

</style>

```

处理导航链接高亮

封装请求模块

安装 axios:

```
npm i axios
```

utils/request.js

```
import axios from 'axios'

const request = axios.create({
  baseURL: 'https://conduit.productionready.io/'
})

export default request
```

登录注册

实现基本登录功能

封装请求方法

表单验证

错误处理

用户注册

存储用户登录状态

(1) 初始化容器数据

```
import Vue from 'vue'
import Vuex from 'vuex'

Vue.use(Vuex)

export default () => {
  return new Vuex.Store({
    state: {
      user: null
    },
    mutations: {
      setUser (state, user) {
        state.user = user
      }
    },
    actions: {}
  })
}
```

(2) 登录成功，将用户信息存入容器

```
this.$store.commit('setUser', data.user)
```

(3) 将登录状态持久化到 Cookie 中

安装 js-cookie

```
npm i js-cookie
```

```
const Cookie = process.client ? require('js-cookie') : undefined

Cookie.set('user', data.user)
```

(4) 从 Cookie 中获取并初始化用户登录状态

安装 cookieparser

```
npm i cookieparser
```

store/index.js

```
actions: {
  nuxtServerInit ({ commit }, { req }) {
    let user = null
    if (req.headers.cookie) {
      // 将请求头中的 Cookie 字符串解析为一个对象
      const parsed = cookieparser.parse(req.headers.cookie)
      try {
        // 将 user 还原为 JavaScript 对象
        user = JSON.parse(parsed.user)
      } catch (err) {
        // No valid cookie found
      }
    }
    commit('setUser', user)
  }
}
```

处理页面访问权限

middleware/auth.js

```
export default function ({ store, redirect }) {
  // If the user is not authenticated
  if (!store.state.user) {
    return redirect('/login')
  }
}
```

middlewares/not-auth.js

```
export default function ({ store, redirect }) {  
  // 已登录状态不允许访问  
  if (store.state.user) {  
    return redirect('/')  
  }  
}
```

在需要判断登录权限的页面中配置使用中间件。

```
export default {  
  ...  
  middleware: ['auth']  
}
```

首页模块

展示公共文章列表

封装请求方法：

```
import request from '@utils/request'  
  
// 获取文章列表  
export const getArticles = params => {  
  return request({  
    method: 'GET',  
    url: '/api/articles',  
    params  
  })  
}
```

获取数据：

```
async asyncData () {  
  const { data } = await getArticles()  
  return data  
}
```

模板绑定：

```
<div  
  class="article-preview"  
  v-for="article in articles"  
  :key="article.slug"  
>  
  <div class="article-meta">  
    <nuxt-link  
      class="author"  
      :to="`/profile/${article.author.username}`"  
    >  
      
```

```

</nuxt-link>
<div class="info">
  <nuxt-link
    class="author"
    :to="`/profile/${article.author.username}`"
  >
    {{ article.author.username }}
  </nuxt-link>
  <span class="date">{{ article.createdAt }}</span>
</div>
<button
  class="btn btn-outline-primary btn-sm pull-xs-right"
  :class="{ active: article.favorited }"
>
  <i class="ion-heart"></i> {{ article.favoritesCount }}
</button>
</div>
<nuxt-link
  :to="{
    name: 'article',
    params: {
      slug: article.slug
    }
  }"
  class="preview-link"
>
<h1>{{ article.title }}</h1>
<p>{{ article.description }}</p>
<span
  @click="$router.push({
    name: 'article',
    params: {
      slug: article.slug
    }
  })"
>Read more...</span>
</nuxt-link>
</div>

```

分页处理

处理分页参数

```

async asyncData ({ query }) {
  const page = Number.parseInt(query.page || 1)
  const limit = 20
  const { data } = await getArticles({
    limit, // 每页大小
    offset: (page - 1) * limit
  })
  return {
    limit,
    page,
    articlesCount: data.articlesCount,
    articles: data.articles
  }
},

```

页码处理

分页模板:

```
<nav>
  <ul class="pagination">
    <li class="page-item active">
      <nuxt-link
        class="page-link"
        to="/"
      >1</nuxt-link>
    </li>
    <li class="page-item">
      <nuxt-link
        class="page-link"
        to="/"
      >2</nuxt-link>
    </li>
    <li class="page-item">
      <nuxt-link
        class="page-link"
        to="/"
      >3</nuxt-link>
    </li>
  </ul>
</nav>
```

1、使用计算属性计算总页码

```
totalPage () {
  return Math.ceil(this.articlesCount / this.limit)
}
```

2、遍历生成页码列表

```
<nav>
  <ul class="pagination">
    <li
      class="page-item"
      :class="{
        active: item === page
      }"
      v-for="item in totalPage"
      :key="item"
    >
      <nuxt-link
        class="page-link"
        :to="{
          name: 'home',
          query: {
            page: item
          }
        }"
      >{{item}}</nuxt-link>
    </li>
  </ul>
</nav>
```

```

      }
    }"
  >{{ item }}</nuxt-link>

</li>
</ul>
</nav>

```

3、设置导航链接

4、响应 query 参数的变化

```
watchQuery: ['page'],
```

TODO 加载中 loading

```

<div class="article-preview">
  Loading articles...
</div>

```

TODO 无内容提示

```

<div v-if="!articles.length" class="article-preview">
  No articles are here... yet.
</div>

```

展示关注文章列表

视图处理

- 没有登录不展示 my-feed
- 处理 tab 切换以及高亮问题

数据处理

封装接口方法：

处理数据获取：

结合分页标签：

统一添加数据 token

统一处理 401

展示文章标签列表

(1) 封装接口请求方法

(2) 数据过滤

- 标签链接
- 分页页码链接

日期格式处理

发布部署

Nuxt.js 提供了一系列常用的命令, 用于开发或发布部署。

命令	描述
nuxt	启动一个热加载的Web服务器 (开发模式) localhost:3000 。
nuxt build	利用webpack编译应用, 压缩JS和CSS资源 (发布用)。
nuxt start	以生产模式启动一个Web服务器 (需要先执行 <code>nuxt build</code>)。
nuxt generate	编译应用, 并依据路由配置生成对应的HTML文件 (用于静态站点的部署)。

如果使用了 Koa/Express 等 Node.js Web 开发框架, 并使用了 Nuxt 作为中间件, 可以自定义 Web 服务器的启动入口:

命令	描述
NODE_ENV=development nodemon server/index.js	启动一个热加载的自定义 Web 服务器 (开发模式)。
NODE_ENV=production node server/index.js	以生产模式启动一个自定义 Web 服务器 (需要先执行 <code>nuxt build</code>)。

参数

您可以使用 `--help` 命令来获取详细用法。常见的命令有:

- `--config-file` 或 `-c`: 指定 `nuxt.config.js` 的文件路径。
- `--spa` 或 `-s`: 禁用服务器端渲染, 使用SPA模式
- `--unix-socket` 或 `-n`: 指定UNIX Socket的路径。

你可以将这些命令添加至 `package.json`:

```
"scripts": {
  "dev": "nuxt",
  "build": "nuxt build",
  "start": "nuxt start",
  "generate": "nuxt generate"
}
```

这样你可以通过 `npm run <command>` 来执行相应的命令。如: `npm run dev`。

提示: 要将参数传递给npm命令, 您需要一个额外的 `--` 脚本名称(例如: `npm run dev --参数 --spa`)

开发模式

可通过以下命令以开发模式启动带热加载特性的 Nuxt 服务:

```
nuxt
// 或
npm run dev
```

发布部署

Nuxt.js 提供了两种发布部署应用的方式: 服务端渲染应用部署 和 静态应用部署。

部署 Nuxt.js 服务端渲染的应用不能直接使用 `nuxt` 命令, 而应该先进行编译构建, 然后再启动 Nuxt 服务, 可通过以下两个命令来完成:

```
nuxt build
nuxt start
```

推荐的 `package.json` 配置如下:

```
{
  "name": "my-app",
  "dependencies": {
    "nuxt": "latest"
  },
  "scripts": {
    "dev": "nuxt",
    "build": "nuxt build",
    "start": "nuxt start"
  }
}
```

提示: 建议将 `.nuxt` 加入 `.npmignore` 和 `.gitignore` 文件中。

```
{
  "apps": [
    {
      "name": "futurestudio-homepage",
      "script": "npm",
      "args": "start"
    }
  ]
}
```

(1) 结合 Express 服务器

```
const { Nuxt, Builder } = require('nuxt')

const app = require('express')()
const isProd = (process.env.NODE_ENV === 'production')
const port = process.env.PORT || 3000

// 用指定的配置对象实例化 Nuxt.js
const config = require('./nuxt.config.js')
config.dev = !isProd
const nuxt = new Nuxt(config)

// 用 Nuxt.js 渲染每个路由
app.use(nuxt.render)

// 在开发模式下启用编译构建和热加载
if (config.dev) {
  new Builder(nuxt).build()
    .then(listen)
} else {
  listen()
}

function listen () {
  // 服务端监听
  app.listen(port, '0.0.0.0')
  console.log('Server listening on `localhost:' + port + '`.`')
}
```

(2) 使用 pm2 运行服务器

```
pm2 init
```

```
module.exports = {
  apps: [{
    name: 'rw',
    script: 'app.js',
    env: {
      NODE_ENV: 'production'
    }
  }]
}
```

(3) 发布到服务器

`github/workflows/main.yml`

```
name: GitHub Actions Demo
on:
  push:
    tags:
      - 'v*'

jobs:
  build-and-deploy:
    runs-on: ubuntu-latest
    steps:

      # 下载源码
      - name: Checkout
        uses: actions/checkout@master

      # 打包构建
      - name: Build
        uses: actions/setup-node@master
      - run: npm install
      - run: npm run build
      - run: tar -zcvf release.tgz .nuxt static app.js nuxt.config.js package.json
        package-lock.json ecosystem.config.js

      # 发布 Release
      - name: Create Release
        id: create_release
        uses: actions/create-release@master
        env:
          GITHUB_TOKEN: ${ secrets.TOKEN }
        with:
          tag_name: ${ github.ref }
          release_name: Release ${ github.ref }
          draft: false
          prerelease: false

      # 上传构建结果到 Release
      - name: Upload Release Asset
        id: upload-release-asset
        uses: actions/upload-release-asset@master
        env:
```

```
GITHUB_TOKEN: ${ secrets.TOKEN }}
